THEARTOF COMPUTER-GUIDED IMPLANTOLOGY

The static approach, better known as computer-guided surgery, refers to the use of a tissue-supported surgical template. This reproduces the virtual implant position directly from computerized tomographic data and this information can be converted to guide templates to be used during surgery, with or without raising a mucoperiosteal flap.

Current state of the art of computer-guided implant ...

The application of computer-guided implant dentistry in clinical practice and factors important to its successful implementation have been reported previously. 8 In the planning software, anatomic information from a CBCT scan is merged with prosthetic information that is derived from either a diagnostic wax-up on mounted study models (for the partially edentulous patient) or from an existing interim or final complete denture (for the completely edentulous patient). For a partially edentulous ...
