Biological Science 5th Scott Freeman

Biology is the scientific study of life. It is a natural science with a broad scope but has several unifying themes that tie it together as a single, coherent field. For instance, all organisms are made up of cells that process hereditary information encoded in genes, which can be transmitted to future generations. Another major theme is evolution, which explains the unity and diversity of life.

Evolution is change in the heritable characteristics of biological populations over successive generations. These characteristics are the expressions of genes that are passed on from parent to offspring during reproduction. Different characteristics tend to exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

Leaf Cell Definition. A leaf cell, by definition, is any cell found within a leaf. However, there are many different kinds of leaf cell, and each plays an integral role in the overall function of the leaf and the plant itself. A single leaf cell may be designed to simply photosynthesize, or create sugars from the energy in light. Other cells are designed to carry these sugars to the phloem, a ...

Ecology: Bighead carp is a powerful filter-feeder with a wide food spectrum that grows fast and reproduces quickly (Xie and Chen 2001), which makes this species a strong competitor. The diet of this species overlaps with that of planktivorous species (fish and invertebrates) and to some extent with that of the young of virtually all native fishes.

Introduction—Developments in Defining PMDD. Premenstrual dysphoric disorder (PMDD), a severe mood disorder, is characterized by cognitive–affective and physical symptoms in the week before menses and affects millions of women worldwide [1, 2]. A significant recent development is the recognition of PMDD as a distinct disorder in the DSM-5 [1]. In 2012, a committee of international experts on ...

Lytic Cycle Definition. The lytic cycle is named for the process of lysis, which occurs when a virus has infected a cell, replicated new virus particles, and bursts through the cell membrane. This releases the new virions, or virus complexes, so they can infect more cells. As seen in the graphic above, the lytic cycle is often accompanied by the lysogenic cycle in many bacteria viruses, known ...
