Combining heuristic and exact methods to solve the PDPTW 3 time that service at location i can begin and l_i , the latest time that service at location i can begin. With regards to the demand, $q_i > 0$ for $v_i \in N^+$ and $q_i < 0$ for $v_i \in N^-$. For each pair of nodes $(v_i; v_j)$ ($0 \leq i = j \leq n$) a non-negative distance d_{ij} is known, $d_{ij} = d_{ji}$, where distance is equal to time. If a vehicle

Combining Heuristic And Exact Methods To Solve The Vehicle

We present a new approach, using an iterative improvement heuristic combined with an LP solver to solve this problem. The solution method presented consists of two parts. The iterative improvement heuristic is used to solve the combinatorial problem of finding the vessel routes and an LP model is used to find time for calls and quantity to load or discharge.

Note that Step 4 in the heuristic is motivated by a combination of the exact algorithm for $a=1$ discussed in Section 3.1 and the exact algorithm for the general case discussed in Section 3.2. In Section 4 we will show how different choices in Steps 4 and 6 impact the efficiency and efficacy of the heuristic, and also explore multistart implementations of the heuristic.
