Community structure, abundance, and morphology The nonrandom nature of morphological patterns within communities has been at the center of this controversy. Null models addressing community-wide dispersions in morphology have produced equivocal results and may be based on assumptions that are too restrictive (e.g., competitive exclusion or displacement).

Changes in community structure potentially due to high nutrient concentration. Abstract Changes in dinoflagellate cyst forming species composition, abundance and morphology along the surface salinity gradient in the Baltic Sea, Kattegat and Skagerrak were investigated and compared with detailed surface salinity data.

Disentangling factors influencing suspended bacterial community structure across distribution system and building plumbing provides insight into microbial control strategies from source to tap. Water quality parameters (residence time, chlorine, and total cells) and bacterial community structure were investigated across a full-scale chlorinated drinking water distribution system.

Application of nitrogen fertilizer affects the soil bacterial community structure and could be a trigger for the development of ARGs. This study explored the effects of two forms of nitrogen (NH₄⁺ -N and NO₃⁻ -N) on the abundance of six ARGs (blaTEM-1 , cmlA , str , sul1 , tetO , and tnpA-4) and bacterial community structure in soils ...

The north-east Atlantic provides a good region for examining the causality of spatial patterns in zooplankton abundance and community structure, since it encompasses different oceanic regimes. In the north ($>50^{\circ}\text{N}$), there is deep winter mixing, followed by seasonal stratification in the spring and summer and a general eutrophy.

Community structure is influenced by many factors, including abiotic factors, species interactions, level of disturbance, and chance events. Some species, such as foundation species and keystone species, play particularly important roles in determining their communities' structure.

In contrast, T-RFLP analysis suggested that soil pH was a key explanatory variable for both AOA and AOB community structure, but a significant relationship between community abundance and nitrification potential was observed only for AOA. High potential nitrification rates indicated that nitrification was mainly driven by AOA in these acidic soils.

The morphology of the community also changed with pressurization to a predominant morphotype of small cocci. The pressure-induced community changes included an increase in the relative abundance of Alphaproteobacteria, Gammaproteobacteria, Actinobacteria, and Flavobacteria largely at the expense of Epsilonproteobacteria. Culturable high-pressure-surviving bacteria were

Community structure of chaetognaths in the North Pacific and its adjacent seas has been studied by Kotori (1976), Terazaki & Miller (1986), Terazaki (1993a), and Matsuda & Taniguchi (2001) based on the samples from the epipelagic (0–200m) to mesopelagic (200–1,000m) zones.
