In 1953, MIT's Whirlwind becomes the first computer to use magnetic core memory. Core memory is made up of tiny “donuts” made of magnetic material strung on wires into a grid. Each core stored a bit, magnetized one way for a “zero,” and the other way for a “one.” The wires could both detect and change the state of a bit.

In computing, memory refers to a device that is used to store information for immediate use in a computer or related computer hardware device. It typically refers to semiconductor memory, specifically metal-oxide-semiconductor (MOS) memory, where data is stored within MOS memory cells on a silicon integrated circuit chip.

Computer memory - Wikipedia

The goal for some people interested in emerging memory technology is a single memory type for both storage and computing, in which any amount of memory attached to the system can be used for either purpose. New technologies such as PCM promise to bring that goal to reality within the next decade.

Memory system organization is a major factor in determining computer performance. Different memory technologies, such as DRAM, SRAM, and hard drives, offer trade-offs in capacity, speed, and cost. This chapter introduced cache and virtual memory organizations that use a hierarchy of memories to approximate an ideal large, fast, inexpensive memory. Main memory is typically built from DRAM, which is significantly slower than the processor.

In computer science, a memory leak is a type of resource leak that occurs when a computer program incorrectly manages memory allocations in a way that memory which is no longer needed is not released. A memory leak may also happen when an object is stored in memory but cannot be accessed by the running code. A memory leak has symptoms similar to a number of other problems and generally can ...

The main memory of a modern computer consists of a number of memory chips, each of which might hold many megabytes (millions of bytes), and still further addressing circuitry selects the appropriate chip for each address. In addition, DRAM requires circuits to detect its stored values and refresh them periodically.
