Amazon.com: mercruiser temperature sender

My manual says , "The Engine Coolant Temperature (ECT) sensor uses a thermistor to control the signal voltage to the ECM. The ECM applies 5 volts on CKT 410 (circuit) to the sensor. When the engine is cold, the sensor (thermistor) resistance is high. As the engine coolant warms up,the sensor resistance becomes less.

BoaterEd - Mercruiser ECT Sensor Question -- Issue Solved

It is the sensor that tells the computer when the engine has warmed up sufficiently for the computer to pay attention to the many other sensors on the engine and exhaust. A cold engine causes the computer to be in the closed loop mode; a malfunctioning temperature sensor will cause the computer to leave the control circuits in this closed loop, causing poor performance, potential stalling and poor gas mileage.
