Once melanoma diagnosis has been established, an innovative molecular assay that can be used to help in the prognosis is the Decision-Dx melanoma gene expression profiling test (Castle Biosciences). Prognosis requires traditional staging and includes looking at parameters like Breslow depth and mitotic index to help clinicians discern whether a ...

Punch biopsy. Open pop-up dialog box. Punch biopsy. Close. Punch biopsy. Punch biopsy. During a punch biopsy, a doctor uses a special circular blade to remove deeper layers of skin for testing. Depending on the size, stitches may be necessary to close the wound. Tests and procedures used to diagnose melanoma include:

Arguably, most of the recent attention concerning molecular cancer diagnostics in the clinical setting has been focused on predictive biomarkers of response to therapy, such as KRAS mutations in metastatic colorectal cancer (mCRC), 12,13 EGFR mutations in advanced NSCLC, 14,15,16 and BRAF mutations in metastatic malignant melanoma. 17,18 The presence or absence of these predictive markers is directly linked to the response rates of particular targeted therapies with small-molecule kinase ...

BRAF mutations were detected in 12 (35%) of 34 cases—11 V600E and 1 V600K. Results of BRAF mutational analysis were concordant in all 34 FNA smear/tissue excision pairs. Thus, melanoma FNA for molecular diagnostics represents a rapid, minimally invasive, and effective management strategy in this era of precision medicine.

The basis for the tests is the detection of DNA or RNA sequences: (1) Assays using Southern Blotting or Southern Transfer Hybridization, (STH), Dot Blot Hybridization (DB), and In Situ Hybridization (ISH). (2) Signal amplified hybridization assays, for example, a hybrid capture assay. (3) Target amplification assays.
