Mount St Helens The Eruption
On March 27, 1980, a series of volcanic explosions and pyroclastic flows began at Mount St. Helens in Skamania County, Washington, United States.A series of phreatic blasts occurred from the summit and escalated until a major explosive eruption took place on May 18, 1980. The eruption, which had a Volcanic Explosivity Index of 5, was the most significant to occur in the contiguous United ...

1980 eruption of Mount St. Helens - Wikipedia
Mount St. Helens (known as Lawelatl'la to the Indigenous Cowlitz people, and Loowit or Louwala-Clough to the Klickitat) is an active stratovolcano located in Skamania County, Washington in the Pacific Northwest region of the United States. It lies 52 miles (83 km) northeast of Portland, Oregon and 98 miles (158 km) south of Seattle. Mount St. Helens takes its English name from the British ...

Mount St. Helens - Wikipedia
Prior to 1980, Mount St. Helens had the shape of a conical, youthful volcano sometimes referred to as the Mount Fuji of America. During the 1980 eruption the upper 400 m (1,300 ft) of the summit was removed by a huge debris avalanche, leaving a 2 x 3.5 km (1.2 x 2.2 mi) horseshoe-shaped crater now partially filled by a lava dome and a glacier.

Mount St. Helens - USGS
We know that Mount St. Helens is the volcano in the Cascades most likely to erupt again in our lifetimes. It is likely that the types, frequencies, and magnitudes of past activity will be repeated in the future. However, neither a large debris avalanche nor a major lateral blast like those of May 18, 1980 is likely now that a deep crater has formed.

Future Eruptions at Mount St. Helens - USGS
Produced by Stephen M. Wessells. USGS scientists recount their experiences before, during and after the May 18, 1980 eruption of Mount St. Helens. Loss of th...

Mount St. Helens
The post-A.D. 1400 segment of the 50,000-year eruptive history of Mount St. Helens (after USGS Bulletin 1383-C). Mount St. Helens is the youngest of the major Cascade volcanoes, in the sense that its visible cone was entirely formed during the past 2,200 years, well after the melting of the last of the Ice Age glaciers about 10,000 years ago.

Mt. St. Helens History
The Mount St. Helens eruption in 1980 caused more than \$1 billion worth of damage, mainly to the timber industry. The economic cost of the 1991 eruption of Mount Pinatubo in the Philippines was estimated at \$7 billion, though it is likely that losses continued to...

Mount Saint Helens | Location, Eruption, & Facts | Britannica
Mount St. Helens had nine main eruptions prior to the 1980 eruption. Each "pulse" of eruptions lasted less than 100 years to up to 5,000 years, with long intervals of dormancy between them.

Mount St. Helens - HISTORY
The Mount St. Helens eruption of May 18, 1980 was the most economically destructive volcanic eruption in the history of the United States causing over \$1 billion of damage. Around 200 houses were destroyed and 57 people were killed by the blast. Roads, bridges, and railways for several miles around the mountain were also destroyed....

In 1980, when Mount St. Helens famously erupted, no one could have dreamed of the magical hiking destination it would become. Over 200 miles of trails allow access to a fascinating landscape marked by gorgeous summer wildflowers, young forests, new lakes, huge mounds of ash and rock and a growing volcanic crater rimmed by the state's newest glacier.

Mount St. Helens Hikes — Washington Trails Association
Mount St. Helens is best known for its large explosive eruption, summit collapse and directed blast of May 18, 1980, which was the most expensive and deadly volcanic event in United States history. The volcano continued erupting during 1980-1986, producing a lava dome within the 1980 crater.

Mount St. Helens | Pacific Northwest Seismic Network
Earliest Eruption: 10,000 BP Oldest Historic Eruption: 1831 Most Recent Eruption: 2008 Number of Eruptions in 20th Century: 5 Largest Eruption:-1855 BP VEI = 6; 1800 VEI = 5; 1980 VEI = 5, 57 deaths Notable Feature(s): During the 1980 eruption, the "Bulge" on north face, lateral blast removed the upper 396 m (1,306.8 ft) of the volcano.

Mount St. Helens - Facts and Figures
The Eruption of Mount St. Helens on May 18, 1980 drastically altered the surrounding landscape. The north side of Mount St. Helens contains the best opportunities for hikers to experience the effects of the eruption. The lush forests that flanked the northern slope of the volcano has become a barren plain of ash deposits and blown down trees.
