Constitutive and Numerical Modeling. Constitutive modelling of geomaterials forms a central theme of research within the NCG. The research team not only derive and develop new models but also implement them into numerical methods for the solution of boundary value problems relevant to geotechnical engineering. Theoretical modelling focuses on developing new models for geomaterials, applicable to clay, sand and other granular materials.

The path dependency of nonlinear materials should be considered in modelling. The numerical solution should be able to accommodate different loading paths in order to apply the constitutive model properly. Different loading path should be specified in order for a correct solution to implement the constitutive model.
