Offshore Structure Fatigue Analysis Design

Fatigue analysis consists of the characterization of short- and long-term cyclic conditions (loading and unloading of cargoes, hydrostatic pressure, hydrodynamic loadings, and machinery and equipment vibrations), the determination of the cyclic forces and strains in structural elements, and the determination of potential degradation in strength and stiffness degradation in structural elements. Fatigue damage to structural components arises because of the cyclic nature of wave or wind loadings.

Fatigue Analysis - an overview | ScienceDirect Topics

Fatigue design rules for offshore structures in the UK, USA and Norway have been developed from common sources but at any one time exhibit marked differences in the fatigue data. The results of research programmes designed to examine the particular circumstances of offshore structures are being used to revise the rules where this is shown to be necessary.
