These particles are so small, compared with the distances between them that the volume (size) of the individual particles can be assumed to be negligible (zero). The particles are in constant random motion, colliding with the walls of the container.

Kinetic Molecular Theory Kinetic Molecular Theory (KMT) allows us to explain the observed macroscopic (measurable) properties of ideal gases (pressure, volume, temperature, etc.) in terms of the microscopic properties of individual gas molecules (or atoms, for monatomic gases). As we will see later, real gases do not follow KMT under all conditions, leading to deviations from the ideal gas law.

Dalton's Law states that the total pressure of a gas mixture is the sum of the partial pressures of all its component gases; i.e., $P_t = p_1 + p_2 + \dots + p_n = \sum p_i$. For a mixture in a fixed volume at constant temperature, by $PV = nRT$ the total pressure is proportional to the total number of moles of all the gases, n_t .
