A seismic source is a device that generates controlled seismic energy used to perform both reflection and refraction seismic surveys. A seismic source can be simple, such as dynamite, or it can use more sophisticated technology, such as a specialized air gun.Seismic sources can provide single pulses or continuous sweeps of energy, generating seismic waves, which travel through a medium such as ...

Up until the 1950's most rubber mountings were designed to take the load in shear. Mountings were circular or sold in long strips, so the capacity could be controlled by size and durometer, or durometer and the cut off length. Shear loading curves are straight line similar to steel springs. The ...

This type of isolation is termed seismic mounting. When an object is truly seismically mounted with respect to the floor, the motions of the object and the floor are completely uncoupled. The term seismic is linked with the study of earthquakes since the magnitude of an earthquake is estimated from the motion of the ground with respect to a ...

aa) Seismic design triggers requiring more ductile detailing where the seismic loads are greater have been defined by a series of five seismic categories based on the worst condition of short and long period cases. Throughout Clause 27 the detailing requirements now relate to these seismic categories rather than IEFaSa(0.2).
