Seismic Stratigraphy, Basin Analysis and Reservoir Characterization free [PDF] The interest in seismic stratigraphic techniques to interpret seismic datasets is expanding continuously. The advent of sophisticated subsurface reservoir studies and 4D monitoring, for optimizing the hydrocarbon production in existing fields, do demonstrate the importance of the 3D seismic methodology.

### Seismic Stratigraphy, Basin Analysis and Reservoir ...

Seismic profiles provide information about the filling of the basin in response to the type of subsidence and sedimentary facies. When interpreting lithology and depositional environment from seismic profiles, it is important to use sedimentological models as aids. If there are well data on lithologies, these must also be integrated.

Second order depositional units (3-50 m.y.; compare Catuneanu, 2006) define the resolution of the seismic stratigraphy investigated. Seismic correlation and stratigraphic ties come from 21 calibration wells; they provide lithologic data, bio-/chronostratigraphic ages, and formation tops (Fig. 2, Fig. 3, Fig. 4 and Table 1). Seismic stratigraphy techniques help us for stratigraphic interpretation of seismic reflectors. It is important because geological concepts of stratigraphy can be applied on seismic data and hence, seismic stratigraphy can be used as a predictive tool for petroleum system elements like reservoir, seal and source rock.

### Seismic stratigraphy - SEG Wiki

When properly applied, seismic stratigraphy provides a powerful foundation for geohistory analysis, helping describe a basin's evolution and the resulting effects upon its spatial and temporal variation in hydrocarbon potential.

Formation of the basin began with right-lateral oblique extension along northwest trending strike/ slip fault systems. Local highs provided sediment supply to syntectonic lows. Seismic facies analysis of this syntectonic fill suggested alluvial to shallow marine fill, possibly in an estuarine setting.
