The example illustrates that no single pre-processing, FE or supervised classification methodology is the absolute best, but a combination of these may be the best solution to the problem posed. The counterpoint to this is that different data sets may require different pre-processing, FE and/or supervised classifier methodologies, as pointed to ...

Four physiological signals, namely ECG, SKT, GSR, and respiration rate, were selected to extract features for recognition. Canonical correlation analysis was adopted as a pattern classifier, and the correct classification ratio is 85.3%. The classification rates for fear, neutral, and joy were 76%, 94%, and 84% respectively.

Machine learning (ML) is the study of computer algorithms that can improve automatically through experience and by the use of data. It is seen as a part of artificial intelligence. Machine learning algorithms build a model based on sample data, known as "training data", in order to make predictions or decisions without being explicitly programmed to do so.

Solving these equations for  $\mathbf{w}$  gives us the corresponding Eigenvectors. But since numpy offers us a neat way to do that with just one line of code, for convenience purposes, I recommend to use numpy over the manual solution :). Once we have found the  $\mathbf{w}$  we can use this to transform our original dataset.
