The whole sample, including the tin capsule, is combusted (1020 °C) in the presence of O₂. The resultant gases are oxidized in the elemental analyzer furnace at 1020 °C loaded with chromium oxide (Cr₂O₃) and cobalt oxide (Co₃O₄/CoO). The NO_x gases

are further reduced to elemental nitrogen (N_2) in a quartz glass tube that is typically filled with reduced (pure) copper (Cu ...

A fossil fuel power station is a thermal power station which burns a fossil fuel, such as coal or natural gas, to produce electricity. Fossil fuel power stations have machinery to convert the heat energy of combustion into mechanical energy, which then operates an

electrical generator. The prime mover may be a steam turbine, a gas turbine or, in small plants, a reciprocating gas engine.
